第一部分 作业

题目 (ML problem 1)

[25pts] Kernel Methods

From Mercer theorem, we know a two variables function $k(\cdot, \cdot)$ is a positive definite kernel function if and only if for any N vectors x_1, x_2, \dots, x_N , their kernel matrix is positive semi-definite. Assume $k_1(\cdot, \cdot)$ and $k_2(\cdot, \cdot)$ are positive definite kernel function for matrices K_1 and K_2 . The element of kernel matrix K is denoted as $K_{ij} = k(x_i, x_j)$. Please proof the kernel function corresponding to the following matrices is positive definite.

- (1) [5pts] $K_3 = a_1 K_1 + a_2 K_2$ where $a_1, a_2 > 0$;
- (2) [10pts] Assume $f(x) = \exp\{-\frac{\|x-\mu\|^2}{2\sigma^2}\}$ where μ and σ are real const. And K_4 is defined by $K_4 = f(X)^T f(X)$, where $f(X) = [f(x_1), f(x_2), \dots, f(x_N)]$;
- (3) [10pts] $K_5 = K_1 \cdot K_2$ where ' \cdot ' means Kronecker product.

解答:

1. 对任意的非零列向量 X : $X^T K_3 X = a_1 (X^T K_1 X) + a_2 (X^T K_2 X)$;

因为 K_1, K_2 都是 positive definite, 所以 $X^T K_1 X, X^T K_2 X > 0$, 而 $a_1, a_2 > 0$; 所以 $X^T K_3 X > 0$

2. 对于任意的非零列向量 X , 假设 $X^T = \{a_1, a_2, \dots, a_n\}$, 所以

$$X^T K_4 X = (X^T f(x)^T)(X f(x)) = a_1^2 f(x_1)^2 + a_2^2 f(x_2)^2 + \dots + a_n^2 f(x_n)^2;$$

因为 $f(x_n)^2 = \exp\{-\frac{\|x-\mu\|^2}{2\sigma^2}\}^2 > 0$, 所以 $X^T K_4 X > 0$, 是正定的;

3. 关于 Kronecker 积的引理:

(1) $(A \cdot B)$ 每一个特征值可表示为 A 与 B 的特征值之积即:

$$\lambda(A) = \{\lambda_1, \dots, \lambda_n\}$$

$$\lambda(B) = \{\mu_1, \dots, \mu_m\}$$

$$\lambda(A \cdot B) = \{\lambda_i \mu_j, i = 1, \dots, n; j = 1, \dots, m\} [1]$$

因为 K_1, K_2 都是 positive definite, 所以它们的特征值 λ_1, λ_2 都是正的;

所以: $\lambda(K_1 \cdot K_2) = \lambda(K_1) \cdot \lambda(K_2)$, 因此 K_5 的特征值是正的, 所以 K_5 是正定矩阵;

题目 (ML problem 2)

[25pts] SVM with Weighted Penalty

Consider the standard SVM optimization problem as follows (i.e., formula (6.35) in book),

$$\begin{aligned} \min_{\mathbf{w}, b, \xi_i} \quad & \frac{1}{2} \|\mathbf{w}\|^2 + C \sum_{i=1}^m \xi_i \\ \text{s.t.} \quad & y_i(\mathbf{w}^T \mathbf{x}_i + b) \geq 1 - \xi_i \\ & \xi_i \geq 0, i = 1, 2, \dots, m. \end{aligned} \quad (1)$$

Note that in (7), for positive and negative examples, the "penalty" of the classification error in the objective function is the same. In the real scenario, the price of "punishment" is different for misclassifying positive and negative examples. For example, considering cancer diagnosis, misclassifying a person who actually has cancer as a healthy person, and misclassifying a healthy person as having cancer, the wrong influence and the cost should not be considered equivalent.

Now, we want to apply $k > 0$ to the "penalty" of the examples that were split in the positive case for the examples with negative classification results (i.e., false positive). For such scenario,

- (1) [10pts] Please give the corresponding SVM optimization problem;
- (2) [15pts] Please give the corresponding dual problem and detailed derivation steps, especially such as KKT conditions.

解答:

1. 注意到 $y_i = \{-1, 1\}$, 所以:

$$f(y_i) = \frac{(k+1) + y_i(k-1)}{2} = \begin{cases} 1 & y_i = -1 \\ k & y_i = +1 \end{cases}$$

因此问题可以转化为:

$$\begin{aligned} \min_{\mathbf{w}, b, \xi_i} \quad & \frac{1}{2} \|\mathbf{w}\|^2 + C * \frac{(k+1) + y_i(k-1)}{2} * \sum_{i=1}^m \xi_i \\ \text{s.t.} \quad & y_i(\mathbf{w}^T \mathbf{x}_i + b) \geq 1 - \xi_i \\ & \xi_i \geq 0, i = 1, 2, \dots, m. \end{aligned} \quad (2)$$

2. 使用拉格朗日乘子法:

$$\begin{aligned} L(w, b, \alpha, \xi, \mu) = & \frac{1}{2} \|w\|^2 + C * \frac{(k+1) + y_i(k-1)}{2} * \sum_{i=1}^m \xi_i \\ & + \sum_{i=1}^m \alpha_i (1 - \xi_i - y_i(w^T w_i + b)) - \sum_{i=1}^m \mu_i \xi_i \end{aligned} \quad (3)$$

其中 α_i, μ_i 是拉格朗日乘子;

令 $L(w, b, \alpha, \xi, \mu)$ 对 Lw, α, ξ_i 偏导置为 0 可得:

$$w = \sum_{i=1}^m \alpha_i y_i x_i \quad (4)$$

$$0 = \sum_{i=1}^m \alpha_i y_i \quad (5)$$

$$C * \frac{(k+1) + y_i(k-1)}{2} = \alpha_i + \mu_i \quad (6)$$

代入可以得到对偶问题:

$$\begin{aligned} \max_{\alpha} \quad & \sum_{i=1}^m \alpha_i - \frac{1}{2} \sum_{i=1}^m \sum_{j=1}^m \alpha_i \alpha_j y_i y_j x_i^T x_j \\ \text{s.t.} \quad & \sum_{i=1}^m \alpha_i y_i \\ & 0 \leq \alpha_i \leq C * \frac{(k+1) + y_i(k-1)}{2}, i = 1, 2, \dots, m. \end{aligned} \quad (7)$$

题目 (ML problem 3)

[25pts] Nearest Neighbor

Let $\mathcal{D} = \{\mathbf{x}_1, \dots, \mathbf{x}_n\}$ be a set of instances sampled completely at random from a p -dimensional unit ball B centered at the origin,

$$B = \{\mathbf{x} : \|\mathbf{x}\|^2 \leq 1\} \subset \mathbb{R}^p. \quad (8)$$

Here, $\|\mathbf{x}\| = \sqrt{\langle \mathbf{x}, \mathbf{x} \rangle}$ and $\langle \cdot, \cdot \rangle$ indicates the dot product of two vectors.

In this assignment, we consider to find the nearest neighbor for the origin. That is, we define the shortest distance between the origin and \mathcal{D} as follows,

$$d^* := \min_{1 \leq i \leq n} \|\mathbf{x}_i\|. \quad (9)$$

It can be seen that d^* is a random variable since $\mathbf{x}_i, \forall 1 \leq i \leq n$ are sampled completely at random.

- (1) [5pts] Assume $p = 2$ and $t \in [0, 1]$, calculate $\Pr(d^* \leq t)$, i.e., the cumulative distribution function (CDF) of random variable d^* .
- (2) [10pts] Show the general formula of CDF of random variable d^* for $p \in \{1, 2, 3, \dots\}$. You may need to use the volume formula of sphere with radius equals to r ,

$$V_p(r) = \frac{(r\sqrt{\pi})^p}{\Gamma(p/2 + 1)}. \quad (10)$$

Here, $\Gamma(1/2) = \sqrt{\pi}$, $\Gamma(1) = 1$, and $\Gamma(x+1) = x\Gamma(x), \forall x > 0$. For $n \in \mathbb{N}^*$, $\Gamma(n+1) = n!$.

- (3) [10pts] Calculate the median of the value of random variable d^* , i.e., calculate the value of t that satisfies $\Pr(d^* \leq t) = 1/2$.

解答:

(1)

$$\begin{aligned} \Pr(d^* \leq t) &= P(\min_{1 \leq i \leq n}(\|x_i\| \leq t) \\ &= 1 - P(\min_{1 \leq i \leq n}(\|x_i\| > t) \\ &= 1 - \prod_{i=1}^n P(\|x_i\| > t) \end{aligned} \quad (11)$$

而因为是二维, $P(\|x_i\| > t) = 1 - P(\|x_i\| < t) = 1 - t^2$

$$\begin{aligned} \Pr(d^* \leq t) &= 1 - \prod_{i=1}^n (1 - t^2) \\ &= 1 - (1 - t^2)^n \end{aligned} \quad (12)$$

- (2) 由第一问: $\Pr(d^* \leq t) = 1 - \prod_{i=1}^n P(\|x_i\| > t)$

而 $P(\|x_i\| > t) = 1 - P(\|x_i\| < t)$

对于 p 维向量 x , $P(\|x_i\| < t) = V_p(t)/V_p(1) = \frac{(t\sqrt{\pi})^p}{(\sqrt{\pi})^p} = t^p$

所以类似的

$$\begin{aligned} \Pr(d^* \leq t) &= 1 - \prod_{i=1}^n (1 - t^p) \\ &= 1 - (1 - t^p)^n \end{aligned} \quad (13)$$

- (3) 代入计算:

$$\begin{aligned} 1 - (1 - t^p)^n &= \frac{1}{2} \\ t^p &= 1 - \left(\frac{1}{2}\right)^{\frac{1}{n}} \\ t &= \left(1 - \left(\frac{1}{2}\right)^{\frac{1}{n}}\right)^{\frac{1}{p}} \end{aligned} \quad (14)$$

注:

题目 (ML problem 4)

[25pts] Principal Component Analysis

(1) [5 pts] Please describe the similarities and differences between PCA and LDA.

(2) [10 pts] Consider 3 data points in the 2-d space: $(-1, 1)$, $(0, 0)$, $(1, 1)$, What is the first principal component? (Maybe you don't really need to solve any SVD or eigenproblem to see this.)

(2) [10 pts] If we projected the data into 1-d subspace, what are their new coordinates?

解答:
